 $T_n \dots \#$  of phylogenetic trees with n labeled leaves.

Pick a phylogenetic tree with n-1 labeled leaves.

3

 $T_n \ldots \#$  of phylogenetic trees with n labeled leaves.

Pick a phylogenetic tree with n-1 labeled leaves. Do the following:

э

 $T_n \dots \#$  of phylogenetic trees with n labeled leaves.

Pick a phylogenetic tree with n-1 labeled leaves. Do the following:

(i) either attach a pendant edge with a node labeled by n to any edge,

 $T_n \dots \#$  of phylogenetic trees with n labeled leaves.

Pick a phylogenetic tree with n-1 labeled leaves.

Do the following:

- (i) either attach a pendant edge with a node labeled by n to any edge,
- (ii) or create a new root with one child the tree and the other the node labeled by n.

 $T_n \dots \#$  of phylogenetic trees with n labeled leaves.

Pick a phylogenetic tree with n-1 labeled leaves.

Do the following:

- (i) either attach a pendant edge with a node labeled by n to any edge,
- (ii) or create a new root with one child the tree and the other the node labeled by n.

This produces all trees of n labeled leaves.

- 4 同 ト 4 三 ト - 4 三 ト - -

 $T_n \dots \#$  of phylogenetic trees with n labeled leaves.

Pick a phylogenetic tree with n-1 labeled leaves.

Do the following:

- (i) either attach a pendant edge with a node labeled by n to any edge,
- (ii) or create a new root with one child the tree and the other the node labeled by n.

This produces all trees of n labeled leaves.

Thus,

$$\mathbf{T}_n = (2n-3)\mathbf{T}_{n-1}$$

and by iteration

$$\mathbf{T}_n = (2n - 3)!!.$$

- $X \ldots$  a finite set.
- Definition

A phylogenetic network is a rooted DAG which has the following nodes:

- (a) *root*: *in-degree* 0 *and out-degree* 1;
- (b) *leaves:* in-degree 1 and out-degree 0; bijectively labeled by X;
- (c) all other nodes have either out-degree 2 and in-degree 1 (tree nodes) or out-degree 1 and in-degree 2 (reticulation nodes).

< □ > < □ > < □ > < □ > < □ > < □ >

 $X \ldots$  a finite set.

Definition

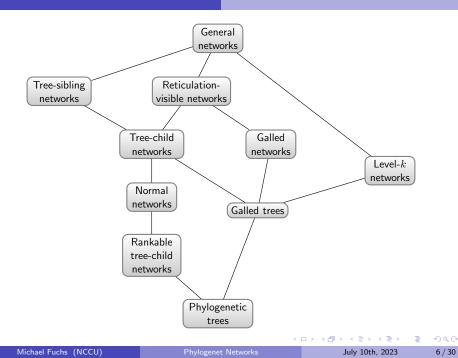

A phylogenetic network is a rooted DAG which has the following nodes:

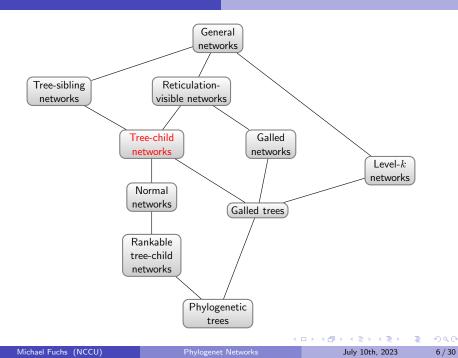

(a) root: in-degree 0 and out-degree 1;

- (b) *leaves:* in-degree 1 and out-degree 0; bijectively labeled by X;
- (c) all other nodes have either out-degree 2 and in-degree 1 (tree nodes) or out-degree 1 and in-degree 2 (reticulation nodes).

Phylogenetic networks have become increasingly popular in recent decades.

They are used to model reticulate evolution which contains reticulation events such as lateral gene transfer or hybridization.

### **TC-Networks**

#### Definition

A phylogenetic network is called tree-child network if every non-leaf node has at least one child which is not a reticulation node.

э

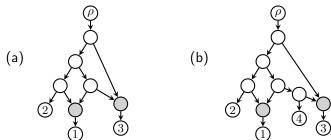

イロト イポト イヨト イヨト

Question: what is the exponential growth rate?

イロト 不得 トイヨト イヨト 二日

 $TC_n \ldots \#$  of tc-networks with n leaves.

Theorem (McDiarmid, Semple, Welsh; 2015)

For constants  $0 < c_1 < c_2$ ,

$$(c_1 n)^{2n} \le \mathrm{TC}_n \le (c_2 n)^{2n}.$$

Question: what is the exponential growth rate?

McDiarmid & Semple & Welsh (2015) also proved stochastic results.

## A Counting Sequence of Words

#### Definition (OEIS; A213863)

Denote by  $a_n$  the number of words on letters  $\{\omega_1, \ldots, \omega_n\}$  so that

- (i) each letter occurs exactly 3 times;
- (ii)  $\omega_i$  has either not occurred or it has occurred at least as often as  $\omega_j$  with j > i.

(日)

# A Counting Sequence of Words

#### Definition (OEIS; A213863)

Denote by  $a_n$  the number of words on letters  $\{\omega_1, \ldots, \omega_n\}$  so that

- (i) each letter occurs exactly 3 times;
- (ii)  $\omega_i$  has either not occurred or it has occurred at least as often as  $\omega_j$  with j > i.

For example,  $a_2 = 7$  because

aaabbb, aababb, aabbab, abaabb, abaabb, baaabb, baabab.

Our encoding by words also works for *d*-combining tc-networks.  $TC_n^{[d]} \dots \#$  of *d*-combining networks with *n* leaves.

Following the same strategy as for d = 2 then gives the following result.

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三 のへで

Our encoding by words also works for *d*-combining tc-networks.  $TC_n^{[d]} \dots \#$  of *d*-combining networks with *n* leaves.

Following the same strategy as for d = 2 then gives the following result.

Theorem (Chang, F. & Liu & Wallner & Yu; 2023+)

We have,

$$\operatorname{TC}_{n}^{[d]} = \Theta\left((n!)^{d} \gamma(d)^{n} e^{3a_{1}\beta(d)n^{1/3}} n^{\alpha(d)}\right),$$

where  $a_1$  is the largest root of the Airy function of the first kind and

$$\alpha(d) = -\frac{d(3d-1)}{2(d+1)}, \qquad \beta(d) = \left(\frac{d-1}{d+1}\right)^{2/3}, \qquad \gamma(d) = 4\frac{(d+1)^{d-1}}{(d-1)!}.$$

### Fixed Number of Reticulation Nodes

The component method can also be extended to *d*-combining tc-networks.

э

イロン 不聞 とくほとう ほとう

## Fixed Number of Reticulation Nodes

The component method can also be extended to *d*-combining tc-networks.

Theorem (Chang & F. & Liu & Wallner & Yu; 2023+) We have,

$$TC_{n,1}^{[3]} = \frac{n(2n+1)}{3}(2n-1)!! - n^2(2n-2)!!;$$
  
$$TC_{n,2}^{[3]} = n(n-1)\left(\frac{70n^2 + 244n + 177}{315}(2n+1)!! - \frac{16n+13}{48}(2n+2)!!\right).$$

In addition, as  $n \to \infty$ ,

$$\mathrm{TC}_{n,k} \sim \frac{2^{dk-1}\sqrt{2}}{(d!)^k k!} \left(\frac{2}{e}\right)^n n^{n+dk-1}$$

for any fixed k.

< □ > < □ > < □ > < □ > < □ > < □ >

• Can one obtain the first-order asymptotics? E.g., for d=2, is there a constant c such that

$$\mathrm{TC}_n \sim c n^{-2/3} e^{a_1(3n)^{1/3}} \left(\frac{12}{e^2}\right)^n n^{2n}?$$

3

(日)

• Can one obtain the first-order asymptotics? E.g., for d = 2, is there a constant c such that

$$\mathrm{TC}_n \sim c n^{-2/3} e^{a_1(3n)^{1/3}} \left(\frac{12}{e^2}\right)^n n^{2n}?$$

Note that the Poisson limit law result implies that

$$\mathrm{TC}_n \sim \sqrt{e} \cdot \mathrm{TC}_{n,n-1}.$$

So, in order to prove the above claim, one needs to improve the method of Elvey Price, Fang, Wallner (2021).
