 $X \ldots$ a finite set.

 $X \ \ldots$ a finite set.

Definition

A phylogenetic network is a rooted DAG with the following nodes:

3

< □ > < 同 > < 回 > < 回 > < 回 >

 $X \ldots$ a finite set.

Definition

A phylogenetic network is a rooted DAG with the following nodes:

(a) *root: in-degree* 0 *and out-degree* 1;

3

- 4 回 ト 4 ヨ ト 4 ヨ ト

 $X \ldots$ a finite set.

Definition

A phylogenetic network is a rooted DAG with the following nodes:

(a) *root*: *in-degree* 0 *and out-degree* 1;

(b) *leaves:* in-degree 1 and out-degree 0; bijectively labeled by X;

3

- 4 回 ト - 4 回 ト

 $X \ldots$ a finite set.

Definition

A phylogenetic network is a rooted DAG with the following nodes:

(a) root: in-degree 0 and out-degree 1;

- (b) *leaves:* in-degree 1 and out-degree 0; bijectively labeled by X;
- (c) all other nodes have either out-degree 2 and in-degree 1 (tree nodes) or out-degree 1 and in-degree 2 (reticulation nodes).

 $X \ldots$ a finite set.

Definition

A phylogenetic network is a rooted DAG with the following nodes:

(a) root: in-degree 0 and out-degree 1;

- (b) *leaves:* in-degree 1 and out-degree 0; bijectively labeled by X;
- (c) all other nodes have either out-degree 2 and in-degree 1 (tree nodes) or out-degree 1 and in-degree 2 (reticulation nodes).

Phylogenetic networks have become increasingly popular in recent decades.

They are used to model reticulate evolution which contains reticulation events such as lateral gene transfer or hybridization.

Computation becomes hard for large n with the method of Cardona & Zhang which uses component graphs whose number increases rapidly!

イロト イポト イヨト イヨト

$\mathrm{TC}_{n,k}$ for small n, k (ii)

Pons & Batle (2021) found a recursive formula for $TC_{n,k}$ based on a (still unproven) conjecture.

- 3

イロト イポト イヨト イヨト

$TC_{n,k}$ for small n, k (ii)

Pons & Batle (2021) found a recursive formula for $TC_{n,k}$ based on a (still unproven) conjecture.

Chang & Liu & F. & Wallner & Yu (2023+) recently also found the following recursive formula:

$$\mathrm{TC}_{n,k} = \frac{n!}{2^{n-1-k}} w_{n-1,k},$$

where

$$\omega_{n,k} = \sum_{m \ge 1} b_{n,k,m}$$

with $b_{n,km}$ given recursively by:

$$b_{n,k,m} = \sum_{j=1}^{m} b_{n-1,k,j} + (n+m+k-2) \sum_{j=1}^{m} b_{n-1,k-1,j}.$$

(4) (日本)

A Sequence of Words

Definition (OEIS; A213863)

Denote by a_n the number of words on letters $\{\omega_1, \ldots, \omega_n\}$ so that

(i) each letter occurs exactly 3 times;

(ii) ω_i has either not occurred or it has occurred at least as often as ω_i with j > i.

A Sequence of Words

Definition (OEIS; A213863)

Denote by a_n the number of words on letters $\{\omega_1, \ldots, \omega_n\}$ so that

- (i) each letter occurs exactly 3 times;
- (ii) ω_i has either not occurred or it has occurred at least as often as ω_j with j > i.

For example, $a_2 = 7$ because

aa abbb, aa babb, aa bbab, ab aa bb, ab aa bb, ba aa bb, ba abab.
